Re: Child's Pit and Quarry Extension, Muskoka, Ontario
Addendum to Noise Impact Assessment

Dear James,

As requested, we have revisited our acoustic analysis of the proposed Child's Pit and Quarry Extension, to assess a proposed modification to a noise berm in the southeast corner of the site to accommodate a buffer zone around an archaeologically significant onsite feature.

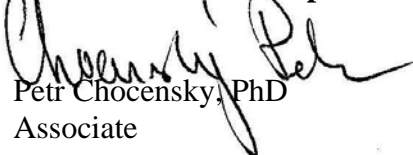

In our original Noise Impact Assessment, dated June 2020, Figure B2 presents a berm on the south side of a future, relocated entrance. The attached figure depicts the proposed new layout of this berm, the southern end of which conforms to the buffer zone around the archaeologically significant feature.

The results of the updated acoustic analysis show that the proposed modification of the berm layout has no material impact on the results reported in the Noise Impact Assessment, the conclusion of which remains the same: the sound levels from the proposed extension will be within the limits of Ministry of the Environment, Conservation and Parks publication NPC-300.

We trust that the above information satisfies your current requirements.

Yours truly,

Howe Gastmeier Chapnik Limited
